1 Colorizing Hindi text

Google translates the Hindi word `भ्रम` as “bewildered”. By using the `luacolor` package it’s possible to colorize glyphs within Hindi text; for example `\color{red}\text{भ्रम}`. You can also add color to the whole word: `\color{red}\text{भ्रम}`.

2 Colorizing Arabic text

Here is some colorized Arabic text: `\color{red}\text{TRTTRT}`

3 Colorizing diacritics

This example is based on [code from tex.stackexchange](#).
