

Pythagorean Theorem

$$\boxed{a^2 + b^2 = c^2}$$

where c is the hypotenuse

This is a Pythagorean theorem $x^2 + y^2 = z^2$ was proved to be invalid for other exponents.

Now,

The next equation has no integer solution.

$$x^n + y^n = z^n$$

Standard L^AT_EX practice is to write inline math by enclosing it between `\(...\)`:

In physics, the mass-energy equivalence is stated by the equation
 $E = mc^2$, discovered in 1905 by Albert Einstein.

Instead of writing (enclosing) inline math between `\(...\)` you can use `$. . . $` to achieve the same result:

In physics, the mass-energy equivalence is stated by the equation
 $E = mc^2$, discovered in 1905 by Albert Einstein.

Or, you can use `\begin{math}... \end{math}`:

In physics, the mass-energy equivalence is stated by the equation
 $E = mc^2$, discovered in 1905 by Albert Einstein.
